

# Self-replication of information-bearing nanoscale patterns

自复制信息载体纳米模式

汇报人：袁慧

2011.12.02

---

# 1. What is the highlight?

- Using DNA tile motifs that can recognize and bind complementary tiles in a pre-programmed fashion!

---

## 2. What did the author do?

- 1. design tile motifs to form a seven-tile seed sequence
  - 2. use the seeds to instruct the formation of a first generation of complementary seven-tile daughter sequences
  - 3. daughter  $\longrightarrow$  granddaughter = initial seed
-

---

## 3.Methods

- We know  $\longrightarrow$  We do not know
    - DNA replication
    - DNA bases
    - DNA backbone
  - materials fabrication
  - BTX  $\xrightarrow{\text{paired}}$  P6HB
  - 7 tile BTX sequences
-

---

## 3.1 BTX and P6HB

- **BTX**---bent triple crossover motif  
four single strands (of seven nucleotide each)
  - **P6HB**---paired 6-helix bundle motif  
two paired BTX letters which contains six helices connected to each other by four small double helices
-

## 3.1 BTX and P6HB

Side view

Cross-section

# 3.2 Simple case

■ A----A'      B----B'

**b**

---

## 3.3 Two labels

- 1. biotinylated nucleotides that bind streptavidin
- 2. large hairpin features

WHY?

1. Read with AFM
  2. Judge the correctness of initial pattern
  3. Check fidelity
-

---

## 3.4 Seed sequence

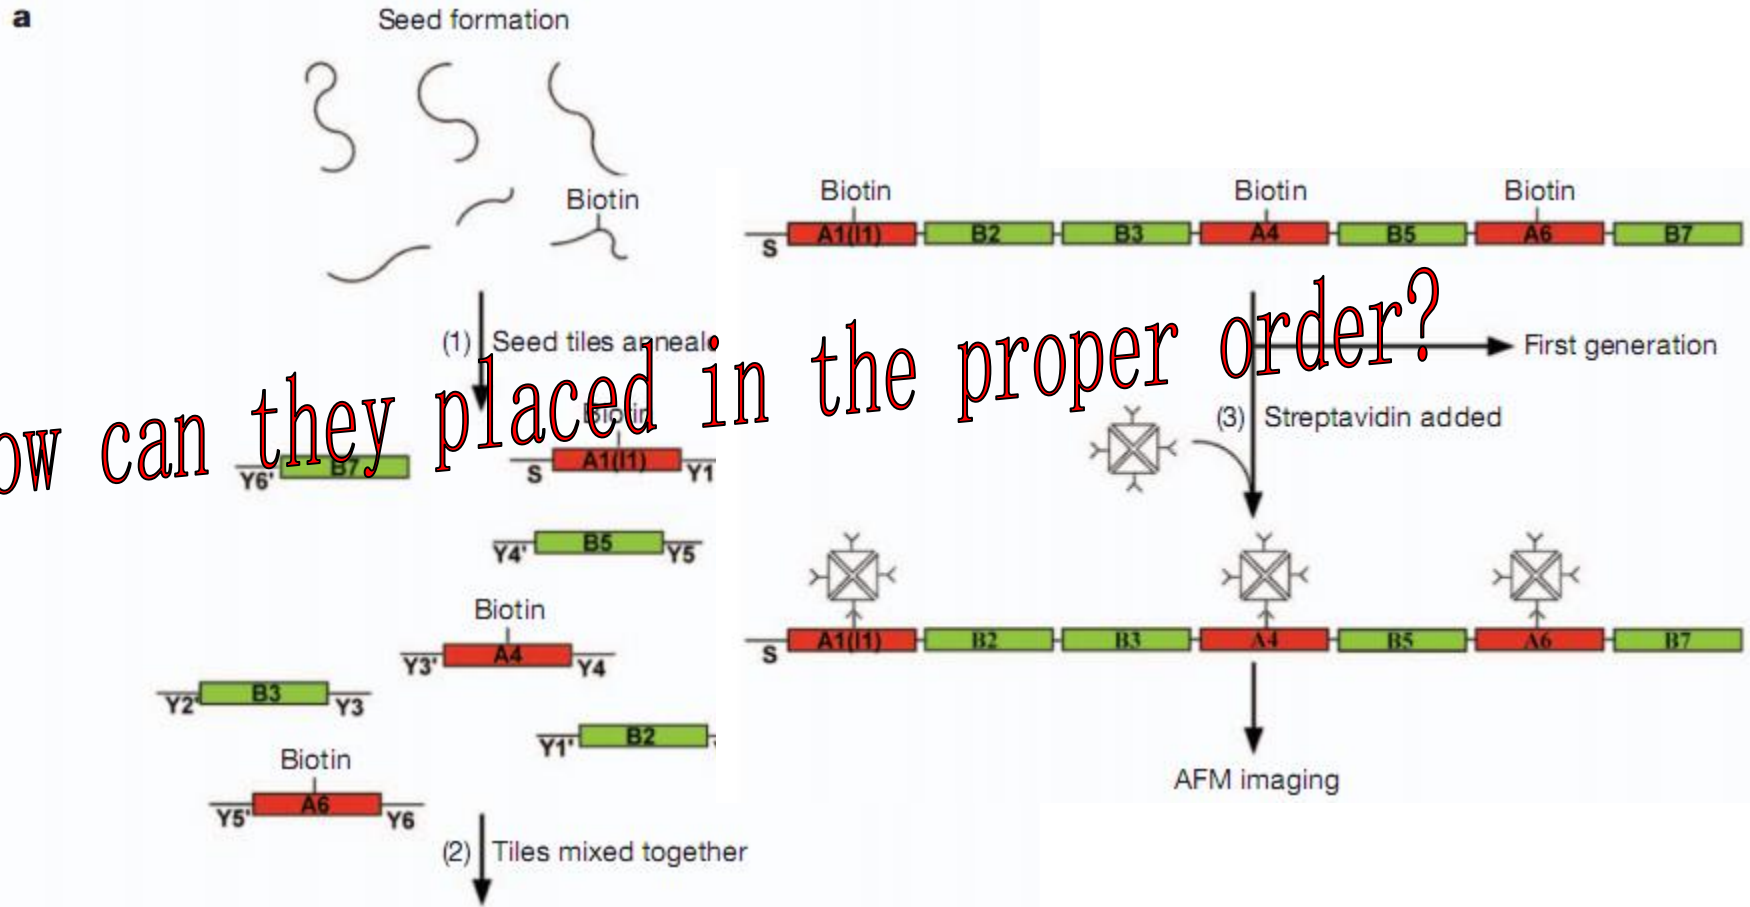

- Seed                    I B B A B A B
- Complementary       I' B' B' A' B' A' B'

initiator I: an A-like tile labelled S that can be attached to a magnetic bead

---

# 3.5 Self-assembly of BTX tiles

How can they be placed in the proper order?

a

unique 16-mer  
sticky ends

# The successful formation of the seeds

# 3.6 Formation of daughter and P6HB

Daughters are significantly sparser than the seeds

# 3.7 Granddaughters

**d**

Hairpins

---

## 4. Conclusion

- Cumbersome
  - Can't achieve exponential amplification
  - Question:  
yield is obviously affected by the removal of seed molecules to produce the daughters
  - Solutions:  
elimination of bead removal steps, by using self-protected hairpins or photoactive molecules for the longitudinal interactions
-

---

# Contributions

- It is possible to replicate not just molecules such as DNA or RNA, but discrete tertiary structures
-

A close-up photograph of a pink rose with water droplets on its petals. The rose is the central focus, with its petals tightly curled in the center and more loosely arranged towards the edges. Several clear water droplets of varying sizes are scattered across the petals, some reflecting light. The background is a soft, out-of-focus pink and white, suggesting other roses or a similar floral setting.

**Rosy expectations:  
robust replication**

---

**Thank  
you !**

---
